SETUP UPDATES

Hey everyone, hopefully you've had a good day?

I'm happy to share that the V1 specification of the Baku setup is now complete.

Baku Setup Changes

For Baku, the main focus was improving the car's rotation while finding as much straight line speed as possible.

To achieve this, I've increased the front to rear wing gap, allowing the car to rotate more effectively through the slower corners without compromising its top speed down the straights. The rear spring stiffness has also been increased to better control the rear ride height at high speed, helping the car become slightly more efficient on the straights.

To support these changes, the rear anti roll bar has been softened to improve traction on corner exit, making it easier to apply the throttle without upsetting the rear of the car. Finally, the rear tyre pressures have been increased to reduce the tyres' rolling resistance, helping the car gain a little more straight line speed.

Overall, the result is a car that rotates more naturally through the slower corners while remaining efficient on the straights and providing strong traction on corner exit.

Wishing you all a great day :)
