SETUP UPDATES

Hey everyone,

Hopefully you all had a good day?

Spa Setup Changes

For Spa, the primary focus was improving the car's efficiency on the straights while increasing front-end grip through the demanding middle sector.

To achieve this, rear suspension stiffness has been increased. This reduces how much the car sags on Spa's long straights, improving ride height control and reducing aerodynamic drag. As an added benefit, the stiffer rear suspension also improves the car's natural rotation through the corners.

To complement these changes, the wing levels have been adjusted to 20 front wing and 0 rear wing. This combination provides stronger front-end grip while reducing drag, helping maximise top speed without sacrificing confidence through the middle sector.

The rear tyre pressures have also been increased to their maximum setting. This reduces rolling resistance, providing a small improvement in straight-line speed while also helping with tyre temperature management in F1 26.

Finally, the rear anti-roll bar has been softened to work alongside the other setup changes. This helps maintain a balanced and predictable rear end, complementing the stiffer rear suspension, higher rear tyre pressures and lower rear wing angle.

Overall, the result is a car that is more efficient on the straights while maintaining the front-end confidence needed to attack Spa's technical middle sector.
