

SETUP UPDATES

Hey everyone,

Hopefully you all had a good day?

I am delighted to share that the V1 specification of the Canada and Monaco setups are now complete.

Canada Setup Changes

The focus of this update was improving the car's rotation and front-end grip, while also increasing consistency through Canada's heavy braking zones and direction changes. Below is a breakdown of the key changes and the reasoning behind them.

Rear Suspension

Rear suspension stiffness has been increased to reduce on-throttle understeer. With the previous rear spring setting, the car was struggling to rotate effectively when applying power on corner exit, costing valuable lap time.

The stiffer rear suspension helps the car rotate more naturally and improves overall responsiveness on throttle.

SETUP UPDATES

Rear Wing

The rear wing has been reduced to complement the rear suspension changes. This further improves the car's ability to rotate through the corner while also providing the added benefit of increased straight-line speed, which is particularly valuable around the Circuit Gilles Villeneuve.

Front Anti-Roll Bar

The front anti-roll bar has been increased to create a more predictable front-end during direction changes. This helps the car maintain a more consistent balance through Canada's chicanes.

Front Ride Height

The front ride height has been lowered to increase overall front-end grip throughout the lap. This allows the front axle to generate more grip, improving turn-in response and helping the car maintain speed through the corner.

Overall, these changes create a more responsive and predictable car, with improved rotation, stronger front-end grip and increased straight-line performance.

SETUP UPDATES

Monaco Setup Changes

The focus of this update was improving traction and rotation through Monaco's slow-speed corners, while also making the car more compliant over the circuit's aggressive kerbs. Below is a breakdown of the key changes and the reasoning behind them.

Rear Suspension

Rear suspension stiffness has been reduced to improve traction on corner exit. Given the number of low-speed corners around Monaco, maximising rear grip when applying the throttle is critical for both qualifying and race pace.

Rear Anti-Roll Bar

The rear anti-roll bar has been increased to improve the car's ability to rotate through the corner. This works hand in hand with the softer rear suspension, allowing the car to maintain strong traction while still rotating effectively through Monaco's tighter sections.

SETUP UPDATES

Rear Ride Height

The rear ride height has been increased to improve the car's ability to deal with Monaco's kerbs. This allows the car to ride the kerbs more effectively while maintaining stability and consistency throughout the lap.

Overall, these changes create a car that offers improved traction, stronger rotation and better compliance over Monaco's unique kerb profile.

Hopefully you all enjoy these setup changes, next up will be Austria :)

Wishing you are a fantastic rest of your day
