

SETUP UPDATES

Hey everyone,
Hopefully you all had a good day?

I am delighted to share that the V1 specification of the Saudi Arabia setup is now complete.

Saudi Arabia Setup Changes

The focus of this update was improving straight-line speed while maintaining the front-end confidence required through Jeddah's high-speed corners. Below is a breakdown of the key changes and the reasoning behind them.

Rear Wing

The rear wing has been reduced to improve straight-line speed and overall efficiency. Given the long flat-out sections around Jeddah, this allows the car to achieve a higher top speed while remaining competitive throughout the lap.

Front Wing

The front wing has been increased to improve front-end grip, particularly through the circuit's fast and flowing corners. This helps the car respond more effectively on turn-in and provides greater confidence through the high-speed sections.

Rear Anti-Roll Bar

The rear anti-roll bar has been softened to complement the revised aerodynamic balance. This helps maintain rear grip and stability, ensuring the car remains predictable despite the lower rear wing level.

Overall, these changes create a car that is faster on the straights while maintaining the balance and confidence needed to attack Jeddah's high-speed corners.

More updates very soon
